The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpCES-1). The human mpCES-1 gene is located on chromosome 9, more specifically to G1944.3. The present invention also describes: (1) antisense compounds, daying a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpCES-1, which specifically hybridise with the nucleic acid mPCES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPCES-1 in cells or tissues; and (3) a method of treating an animal continuation and disease or condition associated with mPGES-1. MPGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, corruptic, antidiabetic, immunomodulatory and cardiavathritic, vasotropic, ophthalmological, immunomodulatory and cardiavaccular activities, and can be used for preparing a composition for treating a disease or condition associated with mPCES-1 inhibitors and in gene therapy. The antisense compound condition associated with mPCES-1 is inhibitors and in gene therapy. The antisense compound disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    chimeric; antisense oligomucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; nootropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ophthalmic, immunological, cardiovascular or neurological disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠ
                                                                                                                                                                                                                                                                              The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9434.3. The present invention also describes: (1) antisense compounds, 9434.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal comparison a disease or condition associated with mPGES-1. MPGES-1 chimeric antidabetic, immunomodulator, cardiant, neuroprotective, cardiant, neuroprotective, antidiabetic, immunomodulatory and cardiovascular activities, and can compute as mPGES-1 inhibitors and in gene therapy. The antisense compound be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Altheimer's condition associated with mPGES-1 e.g., inflammation, Altheimer's condition associated with mPGES-1 e.g., inflammation, injury, or optimalial, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase; inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; notropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer; disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; ss.

```
The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to add 343. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1, which specifically hybridise with he mucleic acid mPGES-1 and inhibits a disease or condition associated with mPGES-1. MPGES-1 chimeric antidiabetic immunomodulator, cardiant, neuroprotective, antidiabetic immunomodulator, and artiforms and infinity inmunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The tuman mEGES-1 gene is located on chromosome 9, more specifically to offers of a more present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal more antisense or condition associated with mPGES-1. MPGES-1 chimeric antishabetic, immunomodulator, cardiant, neuroprotective, antishamatory, neuroprotective, nootropic, antishamatory, neuroprotective, nootropic, antishamatory, neuroprotective, nootropic, antishamatory, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to ogd 4.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal continuation adisease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic, antistlammatory, neuroprotective, nootropic, antisthritic, vasotropic, antislammatory, neuroprotective, nootropic, antisthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound con be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or copithalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mFGES-1; mFGES-1 inhibitor; incresomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; onotropic; onotropic; onotropic; onotropic; onotropic; onotropic; onotropic; onotropic; onotropic; ophthalmological;

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antialnamatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g. inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

                                                                                                                                                                                                                                                                                                                                          The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9434.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal mPGES-1 in cells or tissues; and (3) a method of treating an animal acisense oligonucleotides and antisense compounds have cytostatic, antidiametic, immunomodulator, cardiant, neuroprotective, vasotropic, antidiamatory, neuroprotective, nootropic, antishammatory, neuroprotective, nootropic, antishammatory, neuroprotective, nootropic, antishammatory, neuroprotective, nootropic, antishammatory, neuroprotective, nootropic, antishammatory of phthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischeemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1; Inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardian; neuroprotective; antidinfiammator; neuroprotective; nootropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder;
                                                                                                                                                                                               New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or ischemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to pay 13. The present invention also describes: (1) antisense compounds, chaving a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding compisions its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisanse oligonucleotides and antisense compounds have cytostatic, antisinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1. # inhibitors and in gene therapy. Altahimer's condition associated with mPGES-1. # inhibitors and in gene therapy. The antisense compound also as arthritic associated with mPGES-1 encondition associated with mPGES-1 encondition associated with mPGES-1 encondition.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin B2 synthase (mPGBS-1): The human mpGBS-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGBS-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGBS-1 in cells or tissues; and (3) a method of treating an animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g. inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note= "phosphorothioate linkages and all cytidine residues are 5-methylcytidines"
Human mPGES-1 chimeric antisense oligonucleotide SEQ ID NO:482.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /*tag= c

having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetee, cancer, ischaemia or repertusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpcES-1). The human mpcES-1 gene is located on chromosome 9, more specifically to gene is located on chromosome 9, more specifically to mere specifically to mere specifically to mere specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mpcES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mpcES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpcES-1. MpcES-1 chimeric antisense oligonuclectides and antisense compounds have cytostatic, antisflabetic, immunomodulator, cardiant, neuroprotective, antisflabetic, immunomodulatory and cardiovascular activities, and can be used as mpcES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpcES-1 e.g., inflammation, Alzheimer's

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 modified base
```

```
The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (MPGES-1). The targeted to human microsomal prostaglandin E2 synthase (MPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to operate invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal cartisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic, antisinflammatory, neuroprotective, nootropic, antistriritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound condition associated with mpGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or opththalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; notropic; antiarthric; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer; disease; arthritis; diabetes; cancer; isothaemia; reperfueion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; ss.
                                                                                                                                                                                                                                                                                                                                                           New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The present invention also describes: (1) antisense compounds, og 434.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and mPGES-1, in cells or tissues; and (3) a method of inhibiting the expression of inhibite its expression; (2) a method of inhibiting the expression of maying a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidialmantory, neuroprotective, nouroprotective, contininflammatory, neuroprotective, nouropic, antiantlammatory, neuroprotective, nouropic, antiantlammatory, neuroprotective, nouropic, antiantlammatory, neuroprotective, nouropic, antiantlammatory, neuroprotective, notropic, antiantlammatory, neuroprotective, conditions associated with mPGES-1 e.g., inflammation, Alzheimer's condition associated with a cancer, isonaemia or reperfusion injury, or condition associated with antiantland and a cancer, isonaemia or reperfusion injury, or content in the condition associated with antiantland and an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and determining the length of the resulting amplicon(8). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that include PML; and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a disease and for prediagnosis of such diseases, especially prion diseases to be over a prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also type genes that encode milk proteins.

Controlled by transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This protein (PrP) comprising a polymorphic microsatellite locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                              Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention describes a method of typing (M1) a gene (1) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one bNA region of (1) that includes PML, using as template a DNA sample containing at least one segment of (1); and determining the length of the resulting amplicon(s). Also described are: c determining the length of the resulting amplicon(s). Also described are: c method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML, and prediagnosis (M3) of diseases associated with a gene that include PML. The method is used to identify microsatellite markers, in a disease related gene, that are associated with a prediapsosition to diseases and for prediagnosis of such diseases, especially prion diseases of use associated with a prediapsosition to diseases and for prediagnosis, malignan hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins.

C metabolic diseases; also to type genes that encode milk proteins.

C metabolic diseases; also to type genes that encode milk proteins.

C protein (PrP) comprising a polymorphic microsatellite locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cytostatic; gene therapy; CDK9; cyclin dependent kinase 9; CDK9 associated disorder; hyperproliferative disorder; cancer; human; antisense oligonucleotide; antisense technology; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                             The invention describes a new compound, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding CDK9, specifically hybridises with the nucleic acid encoding CDK9 comprising 7018-bp sequence and inhibits expression of CDK9. Also described are: inhibiting the expression of CDK9 in cells or tissues; screening for a modulator of CDK9; a diagnostic the compound; and treating an animal having a disease or condition associated with CDK9. The oligonucleotide compound is useful for preparing a composition for treating hyperproliferative disorder, e.g. cancer. This sequence represents a human cyclin-dependent kinase 9 (CDK9) antisense oligonucleotide.

This invention describes a novel non-muscle, human myosin-family heavy chain protein, designated MYH14 which maps to chromosome 19q13.3, a region associated with Charcot-Marie-Tooth syndrome. MYH14 is associated with Drain, peripheral nerves, ovary and intestines and has closest homology with the myosin family proteins MYH0, MYH10 and MHC11. The product of the invention is used to identify mutations and alteration in nucleic acids, by Mybridisation. Computer-based comparison of the human nucle myosin heavy chain B) indicated a potential human homologue. A set muscle myosin heavy chain B) indicated a potential human homologue. A set sometic primers was designed and used to amplify cDNA derived from mRNA isolated from the sciatic nerve. The 13 amplicons were sequenced and assembled to form an approximately skb sequence that included an open reading frame for MYH14, but lacked the polyadenylation signal. The corresponding gene contains 40 exons (about 100 kb), entirely present within the bacterial artificial chromosomes Acolosobé, Acolosis and Aconosomes The MYH14 protein corresponds to the hypothetical protein FLJ MYH14 protein corresponds to the hypothetical protein FLJ MYH14 protein corresponds to the hypothetical protein FLJ MYH14 protein corresponds to the hypothetical protein human approximately a PCR primer used to amplify the human approximately approximately approximately approximately approximately and approximately approximately approximately approximately approximately artificial chromosomes Aconosomes Aco

The present invention describes a phosphoramidite compound (I) comprising two or more nucleoside moieties linked by one or more internucleoside phosphorus atoms, where the internucleoside phosphorus atoms are phosphorus (III) atoms. Also described: (I) preparing a trivalent phosphorus multimer or its stereoisomer (I); (2) a trivalent phosphorus multimer derivatised solid support (II); and (3) preparing (II). (I) or seed for the synthesis of oligonucleotides. The present sequence represents a phosphorothioate 21mer oligonucleotide which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        human; ss; short interfering RNA; siRNA; angiogenesis; vascular endothelial growth factor; VEGF, VEGF receptor; Flt-1; Flk-1/KDR; kinase domain region; diabetic retinopathy; age-related macular degeneration; inflammatory disease; psoriasis; rheumatoid arthritis; cancer; breast; retinoblastoma; Wilm's tumour; lymphoma; cytostatic; antidiabetic; ophthalmological; antiinflammatory; antipsoriatic; antirheumatic; antiarthritic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel short interfering RNA (siRNA) comprises sense and antisense RNA strands, useful for inhibiting expression of human vascular endothelial growth factor mRNA, for treating angiogenic disease, e.g. diabetic
                                                              Novel phosphoramidite compound, useful for the synthesis of oligonucleotides, comprising nucleoside moieties linked by one or more internucleoside phosphorus atoms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human Flt-1 DNA sequence, a target for siRNA inhibition SeqID 376
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to novel compositions that comprise short

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a phosphoramidite compound (I) comprising two or more nucleoside moieties linked by one or more internucleoside phosphorus atoms are the internucleoside phosphorus atoms are phosphorus (III) atoms. Also described: (I) preparing a trivalent phosphorus multimer or its stereoisomer (I); (2) a trivalent phosphorus multimer derivatised solid support (II); and (3) preparing (II). (I) or (II) can be used for the synthesis of oligonucleotides. The present sequence represents a phosphorothioate 21mer oligonucleotide which is synthesised in an example from the present invention
                                                                                                                                                                                                                                                                                                        Novel phosphoramidite compound, useful for the synthesis of oligonucleotides, comprising nucleoside moieties linked by one or more internucleoside phosphorus atoms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Phosphorothioate; oligonucleotide synthesis; phosphoramidite; ss.

RESULT 532

ò 셤 cc interfering RNA (siRNA) molecules, which can be used to inhibit corpuses. Specifically, it refers to siRNAs that target and cause RNA1-induced degradation of mRNA from human vascular endochelial growth factor (VEGF), the VEGF receptor (FIt-1) and the FIk-1/KDR (kinase domain corpus) genes, as well as mutants derived thereof. The present invention constructs sense and antisense RNA strands that form an RNA duplex and describes sense and antisense RNA strands that form an RNA duplex and compared to the target mRNA, such that expression is inhibited and the target constructs as such, siRNA administered in combination with a therapeutic agent is useful for treating diseases associated with angiogenesis and the overexpression of VEGF, which include diabetic rethiopathy, agence related macular degeneration, inflammatory disease, psoriasis and concers including breast, retinoblastoma, Wilm's tumour and lymphoma. CC rheumatoid arthritis. Furthermore, it can be used to treat various concers including breast, retinoblastoma, Wilm's tumour and lymphoma. CC phthalmological, antiinflammatory, antipsoriatic, antiinflammatory, antipsoriatic, antiinflammatory, antipsoriatic, antiinflammatory, antipsoriatic, antiinflammatory, coligo, a target for siRNA inhibition of the invention. 8 \pm 8

Novel short interfering RNA (siRNA) comprises sense and antisense RNA strands, useful for inhibiting expression of human vascular endothelial growth factor mRNA, for treating angiogenic disease, e.g. diabetic retinopathy and cancer.

Disclosure, SEQ ID NO 773; 218pp; English.

This invention relates to novel compositions that comprise short interfering RNA (siRNA) molecules, which can be used to inhibit

angiogenesis. Specifically, it refers to siRNAs that target and cause RNAi-induced degradation of mRNA from human vascular endothelial growth factor (VEGF), the VEGF receptor (Filt-1) and the Fik-I/KDR (kinsee domain region) genes, as well as mutants derived thereof. The present invention describes sense and antisense RNA strands that form an RNA duplex and bind to the target mRNA, such that expression is inhibited and the target bind to the target mRNA, such that expression is inhibited and the target capraded. As such, siRNA administered in combination with a therapeutic agent is useful for treating diseases associated with anglogenesis and the overexpression of VEGF, which include diabetic retinopathy, agenelated macular degeneration, inflammatory disease, psoriasis and renumatoid arthritis. Furthermore, it can be used to treat various cancers including breast, retinoblastoma, Wilm's tumour and lymphoma. Accordingly, these compositions exhibit cytostatic, antidiabetic, ophthalmological, antiinflammatory, antippsoriatic, antidiabetic and antiarthritic activities. This oligonucleotide is a human Flk-1/KDR DNA oligo, a target for siRNA inhibition of the invention. \$

New set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes, useful for genotyping diverse genomes of plant and animal systems

Claim 1; SEQ ID NO 4; 60pp; English.

The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the 5' anchored (ISSR)-PCR primer of the invention.

The present sequence is an antisense oligonucleotide specific for the human IL3 receptor. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
con-coding regions of RNAs corresponding to target genes, gene initiation
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
coding regions of RNAs encoding intron-exon borders, the 5'-end, the 3'
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX5512-74. These multiple target oligonucleotides
conditions or mixtures multiple target oligonucleotides
from sequences AAX55180-271) can be used for the antisense treatment of
diseases and conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
acute asthma, allergies, asthma, impeded respiration, respiratory
disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, pancreatic cancer,
colon cancer, breast cancer, lung cancer, pancreatic cancer,
colon cancer, breast cancer, lung cancer, pancreatic cancer,
colon cancer, breast cancer, lung cancer, metastases,
colon cancer, breast cancer, lung cancer, pancreatic metastases,
as all types of cancers which may metastasize or have metastasized
colon cancer, breast cancer which may metastasize or have metastasized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The present invention describes low adenosine (A) content antisense oligonuclectides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonuclectides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activity of target polypeptides associated with lung/respiratory disorders and transmitters, transcription factors, immunoglobulins and antibodies antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and nervous system (CNS) and peripheral nervous and non-nervous system peripheral nervous and non-nervous system peripheral nervous and non-nervous system creceptors, defensins, growth factors, vascociated proteins. The antisense oligonuclectides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactors binding respiratory obstruction and/or bronchoconstriction and/or lung inflammation, allergy(ies) and/or surfactors binding are sessible and alsease or surfactors become and suspense or surfactors binding respirators associated with a disease or surfactors binding respirators and surfactors associated with a disease or surfactors binding are associated with a disease or surfactors binding respirators associated with a disease or surfactors binding respirators associated with a disease or surfactors binding respirators binding are associated with a disease or surfactors binding respirators associated with a disease or surfactors binding respirators associated with a disease or surfactors binding respirators associated win this way to treat disorders and surfactors between the surfacto Low adenosine (A) content antisense oligonucleotides which do not trigge adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions. fragments and antisense oligonucleotides used in the exemplification of infections, bronchitis, condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary emphysema, chronic obstructive pulmonary disease (COPD) ary transplantation rejection, pulmonary infections, bronchil cancer. (EPIG-) EPIGENESIS PHARM INC

Katz E, Pabalan J, Aguilar D; Sandrasagra A, K L, Shahabuddin S; Li Y, San Tang L, Miller S, Nyce JW,

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 10474; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation coodon, coding region, 5 or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 muclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entitificammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of, or reducing sensitivity to adenosine, reducing levels of edenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

This invention describes a novel composition, all rist active agent, comprising oligonucleotides, effective for alleviating to the composition, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and composition of a target polypeptide associated with lung airway or lung dysfunction or cancer polypeptide associated with lung airway or lung dysfunction also describes a kit, that comprises: (a) a delivery of entructions according a carrier and for use of the kit. The composition of the invention has antiallargic, antiinflammatory, antiathmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition of the target manalgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition of the target manalgesic and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory

distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonuclectides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it.
                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequences given in AAH43222-23 are primers which were used to amplify the CDNA encoding human kelch protein 19; Human Kelch protein 19 and its corresponding polynucleotide may be used in the diagnosis and treatment of malignant tumor, hemopathy, HIV infection, immunological diseases and

The invention relates to a replicase complex comprising a hepatitis C virus (HCV) NSSB replicase protein, a linear nucleic acid template and a complementary nucleic acid primer which is annealed to the 3' terminus of the template, where the template is at least three nucleotides and the primer is two or three nucleotides, and the template and primer do not form a stable duplex in solution in the absence of the HCV NSSB protein. The complex is useful for detecting HCV replicase activity and permits establishment of sensitive RNA-dependent RNA polymerase assays to screen and evaluate antiviral inhibitors and to improve the specificity and efficacy of the inhibitors. The complex is also useful in the development of a reliable system for determining kinetic and thermodynamic constants of HCV NSSB-catalysed nucleotide incorporation and investigation of mechanistic inhibitors for mis-incorporation or chain termination.

Specifically, the short RNA template and primer pairs are useful in screening assays which are used for determining kinetic, thermodynamic and mechanistic properties of NSSB replication and ultimately in the replicase activity may be used for developing anti-HCV pharmaccuticals.

Sequences ABK99271-ABK99296 represent HCV NSSB replicase RNA synthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel replicase complex comprising hepatitis C virus NSSB replicase, a 3 nucleotide-long template to which a 2 nucleotide-long primer is annealed, and template and primer which do not form a stable duplex in the absence of HCV NSSB.
                                                                                                                                                                          Hepatitis C virus (HCV) NS5B replicase RNA synthesis template #12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 25;

Claim 1; SEQ ID NO 55473; 9pp; English

```
The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison.

Cor family members of a gene and a cross-species comparison.

Cor family members of a gene and a cross-species comparison.

Cor family members of a gene and a cross-species comparison.

Cor family members of a gene and a cross-species comparison.

Cor family members of a gene and a cross-species comparison.

Cor family methors of any gene, in mapping the 5' termini of mRNA molecules by primer extensions of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the solute for this patent can also be obtained in electronic format directly from USPTO at sequence thml
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

The invention describes a multimeric molecular complex comprising at least 2 compounds, each of which has at least one targeting element directed to a ligand that confers transcytofic or paracellular transporting properties to a molecular complex specifically bound to the ligand. Also described are: a compound comprising at least 2 targeting elements directed to the ligand, a protein compusiang a composition polypeptide having a chemical linkage to at least one targeting element directed to the ligand; a pharmaceutical composition comprising the compound; delivering a biologically active agent to an animal; transporting a biologically active agent through an epithelial barrier; treating a disease in an animal; and identifying a disease in an animal. The complex is useful for preparing a composition for for diagnosing or treating diseases, e.g., osteoporosis, renal failure, collits, gastroenteriis, inflammatory bowel disease, psoriasis, Alzheimer's disease, optic neuropathy or ophthalmoplegia. This sequence represents a linker associated with the isolation of heavy chain regions compensate an animal antibody sysAF polypeptide, that targets the polyimmunoglobulin receptor (pigR) mediator of endocytosis and forward and reverse transcytosis in epithelial cells,
                                                             antipsoriatic; antiinflammatory; neuroprotective; ophthalmological; gastrointestinal; ostoopathic; nephrotropic; gene therapy; multimeric molecular complex; transcytotic transport; paracellular transport; calcitonin; osteoporosis; renal failure; colitis; gastroenteritis; inflammatory bowel disease; psoriasis; Alzheimer's disease; optic neuropathy; ophthalmoplegia; single chain antibody; sFv5AF; linker; heavy chain region; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New multimeric molecular complex, useful for preparing a composition for diagnosing or treating e.g. osteoporosis, renal failure, colitis, gastroenteritis, inflammatory bowel disease, psoriasis or Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0.5%; Score 18.2; DB 1; Length 25; 13.9%; Pred. New NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. diabetes, multiple sclerosis, atherosclerosis, cancer, infections, osteoporosis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a new polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful in the manufacture of endicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX nucleic acids, polypeptides and antibodies are useful for treating, preventing or polypeptides and antibodies, the NOVX nucleic acids, solypeptides and antibodies, the nucleic acids, syndrome, Alzheimer's disease, stroke, tuberous aclarosis, by mippel-Lindau syndrome, Alzheimer's disease, stroke, tuberous aclarosis, cerebral hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral

c munnospecifically to NOVX substances for use in therapeutic or
diagnostic methods. The nucleic acids are further used as hybridisation
c probes, in chromosome mapping, tissue typing, preventive medicine, and
plax macogeneomics. The present nucleic acid sequence represents a probe
that was used in the methods of the invention for detection of human NOVX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from tunour cells and genomic DNA from normal cells. The method involves the cells from the same individual with oligonuclectide primers selected from (i) a nucleotide sequence (CG)xRG, where R is a purine selected from adenine and guanine and x = 3-7, (ii) a nucleotide sequence (CG)xRY, where R is as in (i) and Y is a pyrimidiane selected from cytosine, thymine, and uracil and x = 3-7, (iii) a nucleotide sequence (CG)xRY, where R is as in (i) and X = 3-7, (iv) a nucleotide sequence (CG)xYY, where X is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CA)xRG, where X is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer suitable for amplifying an SSR, identifying (MI) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and identifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the MI, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSRs in the breeding, a
                                                                                                                                                                                                                                                               ö
16, (vi) a nucleotide sequence (CA)xRY, where R is a purine selected from adenine and guanine and Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRR, where R is a purine selected from adenine and guanine and x = 6-16, (viii) a nucleotide sequence (CA)xYY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination of the primers. The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Simple sequence repeat; plant; ds; SSR; ryegrass; fescue; tandem repeat; cereal profiling; grass profiling; seed batch purity testing.
                                                                                                                                                                                                                                                                 ö

```
method for DNA profiling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal seed batches by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal species varieties, for testing the purity of grass or cereal seed batches, and for DNA profiling to establish the distinct identity, uniformity and/or stability of a cultivar. The present sequence is a ryegrass or fescue SSR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New transgenic mice having a genetically modified fibroblast growth factor receptor gene, useful as a model for human chondrodysplasia, e.g. achondroplasia characterized by shortening of the limbs, midface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an animal model for chondrodysplasia, more particularly, to a transgenic mouse model for achondroplasia. This transgenic mouse contains a fibroblast growth factor receptor 3 (FGFR3) gene including a G to A point mutation changing Gly to Arg in codon 380 in its genome. The transgenic mouse is useful as a model for FGFR associated chondrodysplasia, particularly FGFR3 achondroplasia, e.g. shortening of the limbs, midface hypoplasia and large skull. This model may be exploited to gain better understanding of the disease and as an experimental model with which experimental therapy to chondrodysplasias can be exercised. The transgenic mouse is particularly useful as a tool for screening, developing and evaluating drugs with a potential of relieving or abolishing chondrodysplasia syndromes and/or symptoms. The present sequence is a PCR primer used to detect human FGFR3 allele
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; chondrodysplasia; achondroplasia; transgenic mouse; therapy; fibroblast growth factor receptor 3; FGFR3; limb; midface hypoplasia; large skull; drug screening; drug development; transgenic; PCR; primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method for determining if an individual has a tumour cell or site of angiogenesis, or if a treatment is effective in changing angiogenesis or changing a status of a set of target cells, comprising determining if a sample of the subject has an expression comprising determining if a sample of the subject has an expression or Siglec in a cell. Peripheral blood monounclear cell (PBMC) expressed Keratin 14, TIE 1, Salicadhesin or Siglec, and kits containing them from the present invention can be used in a diagnostic method, particularly as an indicator of angiogenesis or to determine presence of a tumour cell. The method of the invention is suitable to determine within a few days if a certain treatment against Kaposi's Sarcoma is successful. ABQ81851 to ABQ82006 represent nucleotide sequence used in the exemplification of the

The invention relates to a novel method for determining whether a treatment is effective in changing a status of a certain set of target cells in an individual. The method comprises obtaining a sample from an individual after initiation of the treatment; and determining whether the sample comprises an expression product of at least one marker gene. The marker gene and a proteinaceous molecule (which can bind to the protein derived from the marker gene of the invention) are useful for determining whether a treatment is effective in counteracting a tumour in an individual, especially Kaposi's Sarcoma. Peripheral blood mononuclear cell (PBMC) expressed keratin 14, TIE I, Salioadhesin, or Siglec I caquences or a fully defined sequence given in the specification, or their analogues are useful as indicators for angiogenesis and for detecting the presence of a tumour cell in an individual. The expression product of a gene comprising a marker gene of the invention is useful as a drug target. The compound is useful for preparing a medicament. This polynucleotide sequence represents a PCR primer of a Kaposi's Sarcoma tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers composition of each Vbeta gene, where and allowing amplification of each Vbeta gene, vbetaRNA or CDNA. The kit is useful for diagnosing organ transplant crejection and diagnosing and treating T-cell associated diseases including autoimmune disease, degenerative nervous system diseases, crejection and diagnosing and treating T-cell associated diseases. Creditorially diseases, infectious diseases, and neoplastic disease. Autoimmune diseases include Addison's disease. Creditorial and Alzahamer's disease. Hypersensitivity diseases include multiple actoris and Alzahamer's disease. Hypersensitivity diseases include multiple credit hypersensitivities such as those present in allargies, Type II hypersensitivities such as those caused to allargies, Type II hypersensitivities such as those caused by viruses such as midections such as those caused by the yeast genus Candida, parasitic infections such as those caused by confined and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases confined as Longe as those caused by hypersensitivity and bacterial infections such as those caused by hypersensity and bacterial infections such as those caused by hypersensity and bacterial infections such as those caused by hypersensity and bacterial infections such as those caused by hypersensity and bacterial infections such as those caused by hypersensity and bacterial infections and cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

```
The invention relates to short interfering nucleic acids (sinA) which downregulate expression of the human platelet-derived growth factor receptor (PDGFY) gene by RNA interference. The sinAs may or may not comprise ribonucleotides and may be double or single stranded. They turther comprise sense and may be double or single stranded. They turther comprise sense oligonucleotide and an antisense oligonucleotide. Specifically, the sinAs include short interfering RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The sinAs can be unmodified or chemically modified, can contain contain and stranded for the in vitro or in vivo delivery of siRNA; conjugates and/or complexes of siRNA; and vectors that express siNA. The siNAs are used to modulate expression of the PDGFr gene in cells, tissue explants or conjudate expression of the PDGFr gene in cells, tissue explants or conjudate expression of the PDGFr gene in cells, tissue explants or treating leukacemia and solid tumours, restenosis, polycystic kidney disease, bronchiolitis, glomerulomephritis and stroke. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single mucleotide polymorphisms).

The present sequence represents the lower strand of a human PDGFr transcript
                                                                                                                                                                                                                       cytostatic; vasotropic; nephrotropic; cerebroprotective; treating leukaemia; solid tumors; restenosis; polycystic kidney disease; bronchiolitis; glomerulnonphritis; stroke; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA;

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human platelet-derived growth factor receptor (PDGFr) gene by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits to the in vitro or in vivo delivery of siRNA; conjugates and/or complexes of siRNA, and vectors that express siNA. The siNAs are used to modulate expression of the PDGFr gene in cells, tissue explants or

ö
organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating leukaemia and solid tumours, restenosis, polycystic kidney disease, bronchiolitis, glomerulonephritis and stroke. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human pDGFrtargeted double-stranded siNA, which is identical to the PDGFr transcript
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polymorphisms among highly interrelated rice plants or among plants of family Brassicae. They can also be used for genetic fingerprinting of plants, allowing detection of polymorphism within one or the same species of plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Primer - for detecting polymorphism in DNA among highly interrelated rice plants or plants of family Brassicae.

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpCES-1). The human megES-1 gene is located on chromosome 9, more specifically to compare the present invention also describes: (1) antisense compounds, 9434.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpCES-1, which specifically hybridise with the nucleic acid mpCES-1 and inhibits its expression; (2) a method of inhibiting the expression of inhibits a disease or condition associated with mPGES-1. MPGES-1 and caridiabetic, immunomodulator, cardiant, neuroprotective, articlabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulatory and cardiovascular activities, and can cophinal mological, immunomodulatory and cardiovascular activities, and can be used as mPCES-1 inhibitors and in gene therapy. The antisease compound con be used as mPCES-1 inhibitors and in gene therapy. The antisease compound condition associated with mPGES-1 eg., inflammation, Alzheimer's condition associated with mPGES-1 is chaemia or reperfusion injury, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to gq34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of inhibits its expression; (2) a method of threating an animal comparation associated with mPGES-1. MPGES-1 and inhibits its expression; (2) a method of treating an animal contisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic, antishifammatory, neuroprotective, nootropic, antiantialmamatory, neuroprotective, nootropic, antiantialmamatory, neuroprotective, nootropic, antianthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or continuous immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel polynucleotide useful for PCR amplification along with two DNA fragment from another set of sequences, or for detecting single nucleotide polymorphism in human gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Novel short interfering RNA (siRNA) comprises sense and antisense RNA strands, useful for inhibiting expression of human vascular endothelial growth factor mRNA, for treating angiogenic disease, e.g. diabetic retinopathy and cancer.

Disclosure, SEQ ID NO 793; 218pp; English.

This invention relates to novel compositions that comprise short interfering RNA (siRNA) molecules, which can be used to inhibit angiogenesis a Specifically, it refers to siRNAs that target and cause RNAi-induced degradation of mRNA from human vascular endothelial growth factor (VEGF), the VEGF receptor (Fit-1) and the Fik-1KCDR (Kinase Gomain region) genes, as well as mutants derived thereof. The present invention describes sense and antisense RNA strands that form an RNA duplex and bind to the target mRNA, such that expression is inhibited and the target degraded. As such, siRNA administered in combination with a therapeutic gene to the overexpression of VEGF, which include diabetic retinopathy, agether account degeneration, inflammatory disease, psoriasis and the thematoid arthritis. Furthermore, it can be used to treat various cancers including breast, retinoblastoma, wilm's tumour and lymphoma. Accordingly, these compositions exhibit cytostatic, antidiabetic, ophthalmological, antidiffammatory, antipsoriatic, antidiabetic activities. This oligonucleotide is a human Fik-1/KDR DNA coligo, a target for siRNA inhibition of the invention. RESULT 558

Mammalian neuroepithelial stem cells and glial restricted precursor - car self renew and differentiate into central nervous system cells, used for generating various types of cells.

Example 26; Page 61; 78pp; English

The present invention describes an isolated, pure population of mammalian neuroepithelial stem cells, which are capable of self-renewal in adherent cededar-cell-independent (AFCI) culture medium and differentiation to central nervous system (CNS) neuronal or glial cells and to neuronal central nervous system (CNS) neuronal or glial cells and to neuronal crest stem cells. Also described is an isolated population of mammalian correctivated precursor (GRP) cells which can self-renew in the AFCI culture medium and can differentiate to CNS glial cells but not to CNS neuronal cells. The stem cells can be used to generate a population of mammalian mnotor neurons by incubating the stem cells but not to CNS neurons and NEP medium lacking chick embryo comprises laminin-coated plates and NEP medium lacking chick embryo cartract. The stem cells can also produce neural crest stem cells by inducing the cells to differentiate in vitro. The inducing step comprises caplating the cells on a laminin-coated substrate and preferably comprises chick embryo extract. Inducing can also comprise adding a dorsalizing capant to the cells, preferably fibroblast growth factor; FGF) and control chick embryo extract. Inducing can also comprise adding a dorsalizing capant to the cells, preferably a bone morphogenetic protein (BMP) such gentiferentiate. At or -7. The stem cells can be used to produce cells to differentiate in vitro to neural creek stem cells, and inducing these cells to differentiate in vitro to neural creek stem cells, and inducing these cells to differentiate in the cap comprise cells or also comprise cells to differentiate in the cells or also comprise cells to differentiate in the cells or also comprise cells to differentiate or cells, and inducing these cells to differentiate or cells to a cells, and inducing these cells to cells and cells, and inducing these cells to cells in the cells, and inducing these cells to cells to cells, and cells, and inducing these cells to cells to cells to cells, and inducing these cells to c in an example from the present invention to amplify different FGF and FGFR genes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Anti-sense oligo:nucleotide(s) for blocking ICAM-1 mRNA translation - for treating septic shock, adult respiratory distress syndrome etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antisense to sequences contained in the pre-mRNA or mature mRNA transcript of human intercellular adhesion molecule-1 (ICAM-1). These oligonucleotides may be used for treating septic shock and the manifestations of septic shock, e.g. inflammation, and vascular and tissue defects. They are also useful in the treatment of septic shock associated diseases, e.g. adult respiratory distress syndrome, multiple organ failure etc. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                          cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (c) cell; (d) cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characteristing cells, e.g. for determining the origin of a cell; its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for determining the an individual, e.g. a fecus. They can also be used for determining the ceffect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired containing cells capable of expressing an homeobox related desired containing the property. The method uses reverse transcriptes polymerase chain reaction gene family. Sequences AA21803-21842 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Genetic proximity, gene expression, cell characterisation, homeobox gene, genetic defect, reverse transcriptase polymerase chain reaction, RT-PCR; kinase gene, protein phosphatase, P450, steroid receptor, cadherin;
                                                                                                                                                                                                                                                                                                                                                                                                                                          family can be selected from a set of homeobox genes, kinase genes, ain phosphatase genes, P450 enzyme genes, steroid receptor
                                                                                                                                                                                                 The invention provides a new method for identifying and characterising
                                                                                                                       Identifying and characterizing cells by comparing the pattern of gene expression in a selected gene family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell compises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (c) determining in the first cell and the second cell; (c) calculating a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its contains whether it carries a genetic defect, or whether it is contained. They can also be used for determining the ceffect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptuse polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZI/R03-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, containing cells capable from a set of homeobox genes, kinase genes, containing cells capable from a set of homeobox genes, kinase genes, containing cells capable from a set of homeobox genes, kinase genes, containing cells capable from a set of homeobox genes, kinase genes, containing cells capable from a set of homeobox genes, kinase genes, containing cells capable containing cells capable containing cells containing cells cel

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                               cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (c) determining in the first cell and the second cell; (c) calculating of expression of genes in a selected gene family; and (c) calculating a precified formula. The methods can be used for characterising cells, e.g. for determining the consideration of a cell; its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for determining the cffect of a selected treatment on a test cell. They can also be used for determining the cffect of a selected treatment on a test cell. They can also be used for property. The method uses reverse transcriptass polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AA217803-218342 represent primers that can be used of in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, processing the pattern of gene family can be selected from a set of homeobox genes, kinase genes, processing the pattern of gene family can be selected from a set of processing receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell comprises: (a) obtaining the first cell and the second cell the pattern co cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its carniformed. They can be used for detecting a selected genetic defect in the ransformed. They can be used for detecting a selected genetic defect in ceffect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired cobtaining the pattern of gene expression in a selected compression in a selected compression in the RT-PCR reactions to determine the pattern of gene expression. The control of gene family can be selected from a set of homeobox genes, kinase genes, control of the control of control of the control of c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chemokine; PCR primer; macrophage inflammation protein 3beta; dendritic cell; disease treatment; MIP-3beta; infection; cancer; allergy; immune response initiation; autoimmune disease; tissue rejection; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            chemokines capable of directing migration of dendritic cells, for treating microbial infections, cancer and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a PCR primer used to amplify the chemokine macrophage inflammation protein 3 beta (MIP 3beta) coding sequence. The PCR product is used in the analysis of dendritic cell response to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of homeobox genes, kinase genes, genes, steroid receptor

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or
different chemokines. The invention relates to the use of chemokines which are capable of directing dendritic cells, in the manufacture of a medicament for the treatment of a disease state. Wethods are included for treating diseases by facilitating or inhibiting the migration or activation of antigen-presenting dendritic cells. The chemokines can be used to initiate, amplify or modulate an immune response. The chemokines are useful for the treatment of disease states e.g. a bacterial, wiral, fungal or parasitic infection, cancer (especially melanomal, breast, pancreatic, colon, lung, glioma, hepatocellular, endometrial, gastric, intestinal, renal, protate, thyroid, ovarian, testicular, liver, head and neck, colorectal, oesophagus, stomach, eye, bladder, glioblastoma and metastatic carcinomas), autoimmune disease, tissue rejection or an

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker or sequence is added to the mixture to carry out an amplification reaction; sequence is added to the mixture to carry out an amplification reaction; sequence is corresponding to the marker is detected from the resultant (c) a signal corresponding to the marker is detected from the resultant corresponding the clones having said marker sequence; (d) the order plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell plates of the specified discrimination in sor are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the and lateral directions; (f) the mixed clones are cultured and the multiwell care detected from the amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell
identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insiptius, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, costeogenesis imperfects and acute intermittent porphyria. Phenotypic craits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune cinflammation, cancer, nervous system diseases and infection by manamatical cancer in erwork and infection by multiple sclerosis, microorganism. The method is also useful.in forensic investigations and microorganism. The method is also useful.in forensic investigations and containing DNA sequence represents a PCR primer specific for a human SNP containing DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;

solated nucleic acid molecules having polymorphisms in known human genes .g. cytochrome p450 and cathepsin S useful as genetic linkage markers or locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 28; Page 160; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human cytochrome P450 Al (CYP4501Al), cytochrome P450 A2 (CYP4501Al), cytochrome P450 A2 (CYP4501Al), adrenergic receptor betal (ADBR1),

aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator (ARWT), cathepsin 8 (CTSS) cyclooxgenase 2 (COX2), diazepam binding inhibitor (DBI), epoxide hydroxylase 2 (EFHX2), 5-1ipoxygenase activating protein (FLAP), glutathione-S-transferase 12 (GST12), histenmine-N-methyl protein (FLAP), glutathione-S-transferase 12 (GST12), histenmine-N-methyl transferase (NWMT), (ABILIKrein 2) KLX2, incotinamide -N-methyl LOXC (Transferase (NWMT), NADPH quinone oxidoreductase 2 (NOC2), unsethyl transferase 10 (GTZBH), uDP-glucuronosyl transferase 2BH (GTZBH), GTHMR2), GTHMR3, GT

WPI; 2002-698522/75.

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 16; Page 130; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid

molecule comprising at least one base variation from that of a known

molecule comprising at least one base variation from that of a known

the molecule comprising at least one base variation from that of a known

polymorphic sequences contained in CYP4501A1, CYPP4501A2, CYP4502B1, ARNT, EPHX2, GST12, NNWT, NOO2, NR112, STW, UGT2B4, UGT2B7, UGT2B15, AHR, MDR1 and/Or MDR3 are useful for screening individuals for altered drug metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2, AHR, MDR1 and/or MDR3 may also be used to screen individuals for susceptibility to cancer. Polymorphic sequences in ADRB1 or GHRR2 are used to screen for altered cardiovascular function, in COX2 for altered susceptibility to colorectal tumours, in DB1 or CHRR1 for altered central nervous system function, in FLAP and HNWT for altered pulmonary, immunological or haematological function, in KLR2 for altered serine protease activity in the prostate, in LTF for altered immunological or haematological function, in CHRR3 or CHRR5 for altered central haematological function, in CHRR3, CHRR4 or CHRR5 for altered central and peripheral nervous system function. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human NADPH quinone oxidoreductase 2 (NQO2) polymorphic sequence #39.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention describes a method of predicting, diagnosing or prognosing a cardiovascular disease by detection of a polynucleotide in a biological sample comprises hybridising at least one of the polynucleotide to a nucleic acid material of a biological sample, thus forming a hybridisation complex, and detecting the hybridisation complex. The polynucleotides, polypeptides, antisense molecule, antibody and reagent are useful for preparing compositions for preventing, predicting or arteriosclerosis, isohaemnt for treating a cardiovascular disease, e.g. arteriosclerosis, isohaemia, angina pectoris, or myocardial infarction. This sequence represents a primer used to identify genes differentially regulated in individuals with cardiovascular disease
                                                                                                                               Predicting, diagnosing or prognosing a cardiovascular disease, e.g. angina, ischemia, myocardial infarction or arteriosclerosis by detection of a polynucleotide in a biological sample comprises detecting a hybridization complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         anorectic; cardiant; hypotensive; antiarteriosclerotic; anorectic; virucide; antibacterial; hypotensive; antiarteriosclerotic; anorectic; virucide; antibacterial; fungicide; protozoacide; noctropic; antipaction anticonvulsant; osteopathic; antilipaemic; antiinflammatory; dermatological; antiasthmatic; antilipaemic; gene therapy; fibroblast growth factor receptor 4; FGFR4; occomplement factor I precursor; matrix metalloproteinase-15 precursor; fibroblast growth factor-21; FGF-21; fibroblast growth factor-21; FGF-21; antighnation in the polypebide variant; hardware and prove factor-21; FGF-21; antighnation in the polypebide variant; hardware and prove factor-21; FGF-21; antighnation in the polypeptide variant; hardware factor-21; FGF-21; antighnation factor-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               anilleukoproteinase 1 precursor; LIV-1; nuclear hormone receptor NOR-1; transmembrane protein-like; beta-neoendorphin-dynorphin precursor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human NOV1 reverse real time quantitative PCR primer SEQ ID NO:148.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0.5%; Score 17.8; DB 1; Length 21; 90.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ADL57203/c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Using chemokine MCP-4 or 6Ckine to attract dendritic cells to the site of an antigen is useful to treat disease states, particularly autoimmune disease, tissue rejection, allergy and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cardiovascular disease differential gene expression related primer #163.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for enhancing an immune response in a mammal, comprising administering chemokine MCP-4 or GCkine or their biologically active fragments. The chemokines are capable of directing the migration of dendritic calls to manufacture a medicament for a disease state. The invention is used to treat disease states, including an autoimmune disease, tissue rejection or an allergy, or a cancer, particularly melanoma, braset, pancreatic, colon, lung, glimma, hepatocellular, endometrial, gastric, intestinal, renal, prostate, thyroid, ovarian, testicular, liver, head and neck, colorectal, cesophagus, stomach, eye or bladder cancer, glioblastoma or metastatic carcinoma. This sequence represents an RT-PCR primer for macrophage inflammatory protein 3 beta (MIP-3 beta), used in analysis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cardiovascular disease, arteriosclerosis; ischaemia; angina pectoris; myocardial infarction; cardiant; antiarteriosclerotic; antianginal; gene therapy; differential gene expression; PCR; primer; ss.

homology to MDC3; NOV3a-5c show homology to T-lymphocyte surface antigen Ly-9 precursor; NOV6a-6m show homology to fibroblast growth factor-21 Ly-9 precursor; NOV6a-6m show homology to fibroblast growth factor-21 polypeptide variant; NOV8a-8g show homology to alpha-2 macroglobulin-like polypeptide variant; NOV8a-8g show homology to antileukoproteinas 1 precursor; NOV9a-9i show homology to LIV-1 protein; NOV10a shows homology to nuclear hormone receptor NOR-1; NOV11a-11j show homology to transmembrane protein-like; NOV12a-12c show homology to beta-necendorphin-dynorphin precursor. The present sequence represents a PCR primer used in the exemplification of the invention.
                                                                                      New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections.

New NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. diabetes, multiple sclerosis, atherosclerosis, cancer, infections, osteoporosis or Parkinson's disease.

Example C; Page 231; 266pp; English.

ö

The present invention relates to a new polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The VOX nucleic acids, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as cancers, Hodgkin disease, Von Hippel-Lindau syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hyperlamer's disease, Hutington's disease, recebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxiatelangiectasia, leukodystrophies, addiction, anxiety, depression, pain,

                                                                                                                      RESULT
obesity, Crohn's disease, osteoporosis, inflammatory bowel disease, infertility, inflammatory bowel disease, atherosclerosis, hypertension, seleroderma, haemophilia, diabetes, pancreatitis, autoimmune disease, asthma, arthritis, immunodeficiencies, HIV, viral, bacterial or parasitic infections, or graft-versus-host disease. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind angiogenesis, in gene therapy, in generation of antibodies that bind diagnostic methods. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present nucleic acid sequence represents a PCR primer that was used in the methods of the invention for amplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polynuclectide useful for PCR amplification along with two DNA fragment from another set of sequences, or for detecting single

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is a ACE mRNA target sequence (nucleotide no. 491) of an enzymatic RNA molecule (ribozyme) which cleaves mRNA associated with the development or maintenance of a cardiovascular condition. The concn. of the ribozyme necessary to effect a therapeutic treatment is lower than that of an antisense oligonocleotide and the specificity of action is higher. (Updated on 25-MAR-2003 to correct PN field.)

Sequences shown in AAV55812 to AAV55827 represent primers used in the course of the invention for the multimerisation of minimal motifs. The invention provides a method for increasing the resistence of a core protein to proteolytic degradation that comprises linking or inserting onto or into the core protein a stabilising polypeptide of formula conto or into the core protein a stabilising polypeptide of formula conto or into the core protein a stabilising polypeptide of formula can be anything between 1-66. X, Y and Z need not be identical from an can be anything between 1-66. X, Y and Z need not be identical from repeat to repeat. Alternatively a nucleic acid encoding a stabilising polypeptide can be linked onto or inserted into a nucleic acid encoding a core protein. The products can be used for treating autoimmune diseases, cancer and inflammation. In particular, the core protein may be an IkappaB regulator protein for the treatment of inflammatory bowel disease, or a nitroreductase protein which can activate nitro drugs in enzyme/prodrug therapy to treat cancer or other pathological conditions. The fusion proteins can also be used in diagnostic methods such as in vivo imaging. (Updated on 27-NUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New fusion proteins resistant to proteolytic degradation - comprising a core protein with a stabilising polypeptide comprising a peptide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Single nucleotide polymorphism; SNP; single nucleotide primer extension;

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the includes kits for determining the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a SNP farming the presence of a SNP, using the coligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insiphidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecte and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune craneze, including, rheumatoid arthritis, multiple sclerosis, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                    The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in bybridisation to a DNA library, in analysis of genetic variation or in bybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring can expression levels, identifying bialplelic markers or polymorphisms, or family members of a gene and a gross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotbloc hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                                                                                                                                                              New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to the identification of nucleic acid molecules (AAI29513-AAI31314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

PTH3R

New nucleic acids encoding parathyroid hormone receptors PTH1R and useful for treating diseases or disorders associated with impaired receptor functions comprises a specific nucleotide sequence.

```
This sequence represents a PCR primer used to isolate DNA encoding the parathyroid hormone receptor type 1 (PTHIR) receptor protein of the invention. The invention also relates to a PTHIR receptor protein.

Antagonists of PTHIR or PTHIR can be used for the treatment of diseases associated with an increase in PTHIR or PTHIR activity, respectively. The peptides are used for diagnosis or prognosis of diseases and disorders associated with PTHIR or PTHIR, such as cancer. The polypeptides can be used as a molecular weight markers on sodium dodecyl sulphate polyacrylamide gel electrophoresis (SDS-PAGE) gels, or on molecular sieve polyacrylamide gel electrophoresis (SDS-PAGE) gels, or on molecular sieve polyacrylamide gel electrophoresis (SDS-PAGE) gels, or on molecular sieve polyacrylamide gel electrophoresis of such period monoclonal antibodies, that bind specifically to a polypeptide and poptides are useful to raise antibodies, including monoclonal antibodies, that bind specifically to a polypeptide. The peptides are useful during diagnosis of diseases and disorders in mammals involving PTHIR or PTHIR sequence and/or expression. Mutations that affect to PTHIR sequence and/or expression levels of PTHIR or PTHIR curlogical nature. The nucleic acid molecules are valuable for chromosomes is an important first seep in correlating those sequences of the design of the discussion of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The present sequence is a PCR primer for the parathyroid hormone type-1 receptor (PTH1R) gene from the zebrafish. It was used to amplify and isolate cDNA encoding this protein. The gene and protein can be used to detect diseases in man where the receptor is either overexpressed or underexpressed, and they can be used to treat these diseases, which may be developmental, physiological or neurological disorders. They can also be used to identify agonists and antagonists which can be used in a similar manner. In addition, the gene can be used for chromosome identification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides the protein and coding sequences of human phosphoesterase 30. The sequences can be used in the treatment of cancer, nosohaemia, HIV infection, immunological diseases and inflammation. The present sequence is a PCR primer for the coding sequence of the invention
The invention relates to human molecular chaperone 18 with cytostatic, virucidal, immunomodulatory, antiinflammatory, haemostatic, nootropic, neuroprotective and anti-HIV activity. The polympeptide and encoded polymucleotide are applicable in diagnosis and treatment of malignant neoplasm, haemopathy, HIV infection, immunological diseases and various inflammations. The present sequence is that of a PCR primer, useful to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             such

                                                                                                                                                                                                                                                                                                  ö
                                                                         Composition for treating mammary tumors associated with aberrant tyrosine kinase receptor activity in nonhuman animals, comprises one or more substances that inhibit the aberrant activity.
                                                                                                                                                     tumours associated with aberrant tyrosine kinase receptor activity in nonhuman animals. (C) comprises one or more substances that inhibit the aberrant tyrosine kinase receptor activity. (C) has cytostacic activity. (C) can be used as a tyrosine kinase receptor inhibitor, and an epidermal growth factor receptor (BGFR) inhibitor. (C) is especially useful for treating canine mammary tumours. The present sequence represents a PCR primer for human EGFR, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes an isolated nucleic acid (I) comprising a polynucleotide having a nucleotide sequence chosen from nucleotide sequence encoding a parathyroid hormone (PTH)/PTH-related peptide (PfHrP)

The invention is useful in the diagnosis and prognosis of certain diseases and disorders that express significantly decreased levels of PTHIR and PTH3R. The invention is also useful in preparaing pharmaceutical compositions and in chromosome assays. The present sequence is a RACE-PCR primer amplified by zebrafish PTHIR CDNA.
receptor (PTHIR receptor) having a fully defined sequence of 536 amino acids as given in the specification, PTHIR receptor, mature PTHIR receptor, PTHIR extracellular or transmembrane domain, and their complement. (I) is useful for diagnosing and treating decrease in the standard or normal level of PTHIR receptor activity in an individual, for chromosome identification. This sequence represents a primer used ioslate the full length cDNA encoding zebrafish PTHIR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New parathyroid hormone receptors designated PTHIR and PTHIR isolated from zebrafish are useful to diagnose and treat parathyroid hormone receptor-related diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention comprises isolated human gene sequences and PCR primer sequences which can be used to detect single nucleotide polymorphisms (SNPs). The DNA sequences of the invention are useful for detecting SNPs existing in human genes and for the diagnosis of human disease. The present DNA sequence represents a human gene PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                        Polynucleotide for detecting single nucleotide polymorphisms existing in human gene, contains isolated human gene having specified sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Williams syndrome cognitive profile; WSCP; cognition; LIM-kinase 1;

This oligonucleotide was designed to amplify the region of homology in the kinase domains of PDGF receptor, HER2, HER3, FGF-FLG, FGF-BEK, insulin receptor and IRR. It was used with another kinase homology domain—based primer (see AAV05313) in the amplification of human LIM-kinase 1 (LIMK1) sequences. The LIMK1 gene is composed of 16 exons (see AAV05315 and AAT95599-T99629) and is located 15.4 kb 3' of elastin in chromosome 7. It encodes a novel protein kinase (see AAM46576). Williams syndrome cognitive profile (WSCP) is detected by determining zygosity of the LIMK1 locus, with hemizygosity being indicative of impaired visuo-spatial constructive cognition. Chromosome 7 deletion analysis allows discrimination between WSCP, SVAS (supra-vascular aortic stenosis) and Williams syndrome
                                                                                                                                                      Diagnosing Williams syndrome cognitive profile from hemi-zygosity of LIMK1 - gene on chromosome 7 encoding new kinase, allowing differentiation from classic Williams syndrome and supra-vascular aortic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PAPP-E; human; pregnancy associated plasma protein E; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis; dysgenetic pregnancy; primer; ss.

the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention

```

                                                      This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, hPAPP-E. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PAPP-E; human; pregnancy associated plasma protein E; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis; dysgenetic pregnancy; primer; ss.

This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein B. hPAPPP. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess

associated plasma protein E, for preventing or aborting pregnancy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, happper. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PAPP-E; human; pregnancy associated plasma protein E; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis; dysgenetic pregnancy; primer; 8s.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
